Hepatitis Serology

HepB surface antigen Negative
HepC-IgG antibody Negative

Comments on Collection 528175025

Hepatitis C IgG may not appear for up to six (6) months after primary infection.
If this is acute phase serum, suggest repeat at a suitable interval.

No evidence of active Hepatitis B infection. If this is an acute sample then retesting in 60-90 days (range 45-180 days) post exposure is indicated.
For further information on serological events in acute (self-limiting) Hepatitis B infection see
<http://protocols.sonichealthcare.com/shared/IP129.pdf>

Toxoplasma Serology

Toxoplasma IgG (CLIA) Negative

Toxoplasma IgM (CLIA) Negative

Comments on Collection 528175025

No antibodies to Toxoplasma detected.

This result may indicate:

- 1.No exposure to Toxoplasma.
- 2.Early infection with Toxoplasma. A recollection in 10-14 days is recommended.

HbA1c

HbA1c (NGSP)	4.9	(	<6.5	)	%
HbA1c (IFCC)	30	(	<48	)	mmol/mol

Comments on Collection 528175025

The currently accepted cut-point for diagnosis of Type 2 Diabetes is an HbA1c level equal to or greater than 6.5% (48 mmol/mol) in patients with normal red blood cell turnover.
An abnormal screening HbA1c equal to or greater than 6.5% (48 mmol/mol) should be confirmed by a repeat HbA1c level as soon as possible, prior to any dietary adjustment or therapeutic intervention.
If the follow up HbA1c is less than 6.5% (48mmol/mol) then the patient does not have diabetes and should be rescreened in 12 months time.
(Ref: MJA 197/4:220-221 (2012))
Patients with HbA1c levels of 5.7 - 6.4% (38 - 46 mmol/mol) may still have a slightly increased risk of microvascular complications according to the AusDiab study.
The Medicare item for HbA1C for diagnosis of Diabetes Mellitus is limited to one test per 12 months; for monitoring Diabetes testing remains unchanged - 4 tests per 12 months.
Further information may be found at MBS online
<http://www9.health.gov.au/mbs/search.cfm>
An alternative test to monitor diabetes such as serum fructosamine is advisable in the presence of altered red cell lifespan.
HbA1c performed on the Sebia Cap3 analyser by capillary electrophoresis.

Name of Test: S-_LIPID PROFILE
Requested: 24/01/2025 **Collected:** 02/02/2025 **Reported:** 03/02/2025 04:45

Clinical notes: 8-12 hours fasting

Clinical Notes : 8-12 hours fasting

Lipid Profile

Cholesterol	4.5	(<5.6)	mmol/L
Triglyceride	0.6	(<2.1)	mmol/L
HDL	1.65	(>1.09)	mmol/L
LDL	2.6	(<4.1)	mmol/L
Tot Chol/HDL	2.7	(<4.6)	
Non HDLC	2.85	(<3.81)	mmol/L

Comments on Lab Id: 528175025

LDL is now calculated by the Sampson equation which allows an accurate result at higher triglyceride levels.

The National Vascular Disease Prevention Alliance (NVDPA) guidelines recommend a target level of less than 2.5 mmol/L for non-HDL.

TARGET LEVELS:

The National Vascular Disease Prevention Alliance (NVDPA) treatment target levels for high risk people (known coronary heart and other arterial disease, diabetes, chronic renal failure, Aboriginal and Torres Strait Islander peoples and familial hyperlipidaemic conditions) are:

Total Cholesterol	<4.0	mmol/L
HDL-Cholesterol	>=1.00	mmol/L
Fasting Triglycerides	<2.0	mmol/L
Non-HDL Cholesterol	<2.5	mmol/L

Increased non-HDL Cholesterol is the most significant marker for subclinical atherosclerosis (ref: Cardiology Today 2013; 3(2) : pp25-27).

Comments on Lab Id: 528175025

Normal Iron Status.

All patients with low or equivocal vitamin B12 results (400 pmol/L or less) will be routinely tested for holo-transcobalamin (active B12) to clarify the B12 status.

Both tests are now Medicare rebateable. Vitamin B12 concentrations over 400 pmol/L are generally considered replete.

C Reactive Protein

CRP 0.8 (<5) mg/L

Comments on Lab Id: 528175025

CRP is a more sensitive early indicator of an acute phase response than is ESR. It also returns towards normal more rapidly with improvement or resolution of the disease process.

If CRP is elevated, it can indicate disease activity of an inflammatory, infective or neoplastic nature.

Artefactually decreased CRP values occur when patients are treated with antibiotics containing carboxypenicillins including Ticarcillin.

Syphilis Serology

Syphilis (CMIA) Screen Negative

Comments on Collection 528175025

No treponemal antibodies detected.

The Syphilis TP Chemiluminescent Microparticle Immunoassay (CMIA) is a screening test for T.pallidum antibodies.

This result may indicate:

1. no exposure to T.pallidum.
2. very early primary syphilis. If risk factors exist a further sample should be tested in 2-3 weeks. In symptomatic patients, a swab of mucocutaneous lesions for the detection of T.pallidum DNA by PCR may be positive before antibody production commences.

Repeat antenatal syphilis screening for high risk subjects should be considered at 28-32 weeks gestation and at delivery.

Requested: 24/01/2025 **Collected:** 02/02/2025 **Reported:** 03/02/2025 04:45

Clinical notes: 8-12 hours fasting

Clinical Notes : 8-12 hours fasting

Gonadal Hormones

Progesterone 0.9 nmol/L

Reference Progesterone
Limits nmol/L
Follicular <0.5 - 2.5
Mid-Cycle 2.5 - 12.0
Luteal 12.0 - 90.0
Menopausal <2.2
OCP <1.5

EA

Sullivan Nicolaides Pty Ltd. ABN 38 078 202 196. NATA/RCPA Accreditation No 1964

Tests Completed: Glucose, HDL-Cholesterol, Iron Studies, CRP, E/LFT, TFTH,
Vitamin B12, Folate (Serum), Syphilis Serology,
Progesterone, Prolactin, Vitamin D, FBE

Tests Pending : HBsAg, HepC-IgG, HbA1c, Abs, CMV, Toxoplasma

Sample Pending : C trach PCR, N gono PCR, Urine MCS, Swab MCS Gen1, Faeces 1 MCS/OCP

DNA consistent with the presence of Blastocystis hominis has been detected using PCR with specific primers and probe. The pathogenic role of Blastocystis spp has not been proven, particularly in immunocompetent individuals. Using molecular techniques, the overall prevalence in our test population is 17%. Individuals may be colonised with this organism and do not need treatment. It can be acquired by contact with animals including pets or contaminated water. Potentially pathogenic or animal strains cannot be differentiated by the current available tests. Screening for clearance of the organism or testing of family members is not recommended.

<http://www.rcpa.edu.au/Library/College-Policies/Guidelines/Faecal-pathogen-testing-by-PCR>
Only the reported enteropathogens have been tested.

All bacterial causes of gastroenteritis reported by PCR are cultured for recovery of isolates subject to organism viability and a further report issued. Some clinical indications e.g overseas travel, eosinophilia, seafood or antibiotic ingestion will require additional parasite concentration examination, culture setup or molecular testing to detect alternative pathogens e.g. hookworm, strongyloides, Vibrios, Clostridium difficile infection (CDI), Enterohaemorrhagic E. coli (STEC). These indications should be highlighted on the request.

Roche LightMix Gastroenteritis multiplex PCR assays were utilised for testing.
For further enquiries regarding these results please contact
Dr Jenny Robson or Dr Sarah Cherian (07 3377 8534).
