COMMENT

In the absence/low number of leucocytes the likelihood of a urinary tract infection is low. Culture has been performed. A further report will be issued if there is significant growth within the next 48 hours.

Urinary cast microscopy is no longer performed as part of a routine urine analysis. If required, please provide a fresh specimen and request investigation for casts as part of the analysis.

ULTRASOUND PELVIS

Clinical Details: Non specific abdominal symptoms with lower abdominal pain and epigastric pain with bloating ? Ovarian pathology.

Findings: Transabdominal and transvaginal with 3D scanning has been performed. Today's scan was performed in week 4 of the menstrual cycle.

The uterus is anteverted, measuring 86 x 67 x 46 mm. The myometrium is homogeneous.

The endometrium is regular and measures 13 mm. This is consistent with the menstrual phase.

The right ovary volume measures 7 mL. It is mobile and non-tender.

It contains a 15 x 15 x 14 mm solid lesion in the right ovary. There is circumferential colour Doppler flow in the wall of the lesion, minimal internal vascular flow detected within the lesion.

Normal appearance of the left ovary, volume 3 mL. It is mobile and non-tender.

There is no free fluid.

Both kidneys are normal.

Comment: 15 mm heterogenous focal vascular lesion within the right ovary is non-specific, but a followup scan in about 6 weeks I would be recommended to check for resolution.

Clinical Details: Right ovarian vascular non-specific area noted on previous scan, for review. ? Resolution. ? Interval change.

Findings: Comparison made with the prior imaging performed on 10 November 2023. Transabdominal and transvaginal with 3D scanning has been performed. Today's scan was performed in week 3 of the menstrual cycle.

The uterus is anteverted, measuring 89 x 56 x 39 mm. The myometrium is homogeneous.

The endometrium is regular and measures 14 mm. This is consistent with the menstrual phase.

Normal appearance of the right ovary, volume 2 mL. It is mobile and non-tender.

The left ovary volume measures 7 mL. It is mobile and non-tender. It contains a corpus luteum, measuring 18 mm.

There is no adnexal mass or free fluid.

Comment: Interval resolution of the non-specific changes at the right ovary in the previous scan. No pelvic abnormality is identified today.

Coeliac disease is unlikely provided the patient has not been on a gluten free diet.

RECOMMENDATIONS

If clinical suspicion remains high, tests on a fresh blood sample for HLA DQ2/DQ8 are recommended. Negative DQ2/DQ8 virtually excludes coeliac disease. If DQ2/DQ8 positive, small bowel biopsy may be required.
