X-RAY FULL SPINE AND PELVIS

Clinical Notes:
Lumbar degeneration and arthritis? Cervical spine arthritis? Thoracic spine arthritis? Right hip arthritis?

Report:
Straightening-reversal of the cervical lordosis with multilevel degenerative spondylolisthesis. Multilevel cervical intervertebral disc degeneration with up to moderate disc height loss and marginal vertebral osteophytes, the latter most pronounced at the anterior aspect of C4-5. Multilevel cervical facet joint arthropathy.

Marginal mid thoracic vertebral deviation to the right. Sagittal thoracic vertebral alignment is satisfactory. Vertebral body heights are preserved. Low-grade multilevel intervertebral disc degeneration and there is multilevel thoracic facet joint arthropathy.

Mild lumbar levoscoliosis. Multilevel degenerative grade 1 retrolisthesis. Lumbar vertebral body heights are preserved. No high-grade disc height loss. Multilevel lumbar facet joint arthropathy.

There is at least mild bilateral hip joint space narrowing with low-grade marginal osteophytes. An 8mm focus of calcification adjacent to the right greater trochanter likely embedded within the gluteal tendon. Low-grade degeneration of the pubic symphysis and sacroiliac joints. No evidence of sacroiliitis. Right downward pelvic tilt.

Thank you for your referral.

Kind Regards,

Electronically Signed by:
