Accession: 86.24057198
D.O.B: 24/02/2013
Sonographer: mbland

ULTRASOUND RIGHT HAND

CLINICAL DETAILS:

Tenderness and reduced ROM after injury? Tendonitis

REPORT:

There is a small volume effusion arising from the 1st metacarpophalangeal joint at the palmar aspect of the right thumb, coinciding with the region of symptoms. No internal vascularity to suggest an active synovitis. The ulnar and radial collateral ligaments of the MCP joint remain intact. Interphalangeal joint unremarkable.
Normal appearance of the extensor and flexor tendons of the thumb.

CONCLUSION:

Overall, the presence of fluid within the 1st MCPJ is nonspecific. This could be secondary to underlying capsular injury. No other finding of significance.
