ULTRASOUND LEFT HIP

Clinical Indications:
Injury and subsequent L) hip/gluteal pain. ? cause ? torn glut.

Report:

There is thickening of the anterior capsule (11mm) with a mild effusion containing anechoic fluid. Generalised cortical irregularity of the femoral head

and neck observed. No paralabral cyst. The iliopsoas tendon and bursa are normal.

There is tendinopathy of gluteus medius. No discrete tear noted. Bony enthesial change of the tendinous insertion is observed. The gluteus minimus tendon is

normal and intact. Mild thickening of the trochanteric bursa (2.6mm).
Elicitation of point tenderness over the anterior fibres of gluteus medius
and
trochanteric bursa. Normal appearance of the TFL origin.

At the lateral inferior area of the buttock (ROI), the musculature appears
intact.

Her area of maximum tenderness corresponds to the trochanteric bursa.

Conclusion:

1. Gluteus medius tendinopathy.
2. Small anterior hip joint effusion.
3. Mild thickening of the trochanteric bursa.
